

Can a fiber optic splitter connect to the internet

Overview

In FTTH networks, optical cables are split to connect multiple homes to a single fiber optic connection, providing high-speed internet and data services. These unassuming devices enable a single optical signal to be divided into multiple paths, making them indispensable for sharing. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port. 1x32 splits were common in North America for G-PON architectures. These devices help you control light signals well.
