Functions and Applications of Base Station Optical Modules

Overview

Optical-to-Electrical Conversion: Detects and converts optical pulses into electronic signals. High Responsivity: Ensures efficient detection at various wavelengths, typically 850nm, 1310nm, or 1550nm. In base stations, optical chips serve the following functions: Laser. An optical module usually consists of an optical transmitting device (TOSA, including a laser), an optical receiving device (ROSA, including a photodetector), functional circuits,main control circuit board (PCBA), housing and optical (electrical) interface and other components. How do optical. The operation of base stations requires a large number of optical modules for interconnection between devices, and we will talk about the application of optical modules in mobile communication base stations. Modulator — encodes data onto the light. Together, lasers, modulators, and. What is Optical Module?
