

How are optical cables and electrical cables connected

Overview

Optical interconnects deploy fiber optic cabling to achieve the linkage whereas electrical interconnects use traditional copper wiring. In a nutshell, these interconnects do exactly what they denote through their nomenclature: they connect critical devices, enabling transmission of. Data transfer and telecommunications have been transformed by optical fiber technology. It consists of tiny glass or plastic fibers that can carry data as light pulses. The first low-loss optical fiber was created in 1970 by Robert Maurer, Donald. For monitoring and managing networks, they use a variety of means of communications, including running fiber optic cables along the transmission and distribution towers, radio links and contracting landline and cellular communications services from telecom carriers. However, for those new to this technology, inserting an optical cable correctly can be a daunting task.
