

Installation of cable trays at contraction joints

Overview

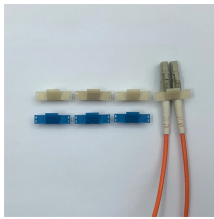

The cable tray needs to be anchored at the support closest to the midpoint between the expansion joints with hold down clamps and secured by expansion guides at all other support locations. The expansion guides allow the cable tray to slide back and forth as it contracts. Cable tray systems, essential for supporting electrical cables, are subject to thermal expansion and contraction due to temperature fluctuations. As cables and trays expand or contract, they can cause stress on the structure, leading to potential damage or misalignment. The metal gets longer, and the heat becomes excessive. Our knowledgeable production team works closely with each customer to provide quality solutions based on your schedule and budget. Once the temperature differential is maintained, spacing is kept to keep cables in place when the tray is set to the minimum bend radius for cables as they exit the bottom of the cable tray.
