# Low-voltage power fiber optic communication backhaul

## Overview

Low-voltage wiring carries 50V or less and powers business-critical systems like data/Ethernet (Cat5e/Cat6/Cat6a), VoIP, security, A/V, building automation, and fiber backbones. From the core to the edge, your network is adding connected devices and new smart-building services all the time. The opportunities and efficiencies they offer speak for themselves—but, as they spread to locations both indoors and out, you're probably feeling the crunch caused by not having enough. Low voltage cabling refers to the wiring used to carry electrical currents at lower voltages than standard electrical wiring, typically below 50 volts. Low-voltage cables are essential in systems that require constant data flow or communication but do not need any higher voltage for electrical. Ten years ago, low voltage cabling on a construction project meant a couple of phone jacks and maybe a coax run to each room. What is the fiber backhaul definition?

A fiber backhaul network moves traffic from local access points to central core networks or the public internet., ber optics and broadband over power lines, across the same overhead transmission and distribution power grid. ©
