A breaker compartment in an LV panel is usually used to house Air Circuit Breakers (ACB) and Molded Case Circuit Breakers (MCCB) that can withstand higher ampere ratings rather than miniature (MCB) and earth leakage circuit breakers. In each compartment, circuit breaker cells are used to house breakers. These compartments can normally hold up to fo. It is usually located at the backside of the breaker compartment, which is also compartmentalized by solid barriers from the breaker compartment. It houses the main busbar system, which is connected to the fixed upper isolating contacts of the main switchgear apparatus through branch connections. The main busbars are made of high conductivity coppe. A typical cable compartment has hinged doors or removable coverthat enable access to landing cable lugs for the aim of termination. A cable compartment arrangement may be of a rear or front access type depending on the type of switchgear panel installed or selected for the project. In most cases, a front

access panel is found where there is not muc.
