

Optical module loses network connection due to heat

Overview

Indicates the optic is operating in a high-temperature environment. If temperature remains high after improving airflow → relocate optic or replace if thermal issues persist. Clear and re-read alarms/DOM; verify link state on both ends. Reseat optics; clean LC connectors on. There are multiple ways that optical modules fail in common ways that can interrupt network connectivity. This is typically due to one of the following failures: hardware defect, poor seating, or incompatibility. The Problem: The laser diode (Tx) or photodetector (Rx) within the module can degrade over time or fail prematurely. While they're designed to operate within specified temperature ranges, running a module above its rated operating temperature causes measurable performance degradation and can lead to permanent. SEO Keywords: signal loss, weak optical power, transceiver link down, fiber cable damage Thermal failures are a frequent concern in data centers, especially for high-speed 10G/25G/100G modules. The following figure shows the QSFP-DD transceiver, but the procedures outlined in this document apply to all pluggable transceivers. However, during installation and daily operation, various issues may arise.
