

Outdoor Installation Method of Optical Cable Terminal Box

Overview

This guide walks through a practical, real-world installation process used in FTTH deployments. Covers mounting, splicing, routing, labeling, and testing for indoor/outdoor use. Installing a fiber optic termination box is one of those jobs that looks simple on paper, but it's easy to do poorly in the field. They also feature resistance to moisture, impact, chemical exposure. Prepare cable ends by sealing gel-filled cables and protecting buffer tubes to prevent water ingress and physical damage. Configurable for either patch only, patch and splice (Clearfield's in-cassette splicing solution) or MPO plug-and-play, Outdoor Wall Boxes support all cable scenarios for the outside. A fiber termination box is the standard instrument used in fiber optic networks to connect, secure, and protect optical fibers at the terminating point. It functions as a junction between the incoming fiber cable and the outgoing customer-side fiber cable, where one fiber can be spliced, patched.
