

The Role of the Light Decay Enhancement Module

Overview

In summary, the main contribution is three-fold: We propose an edge computing driven deep learning method for object detection in low-light conditions, which designs the overall structure of cloud-based enhancement and edge-based detection stages to keep balance between edge. In summary, the main contribution is three-fold: We propose an edge computing driven deep learning method for object detection in low-light conditions, which designs the overall structure of cloud-based enhancement and edge-based detection stages to keep balance between edge. Low-light image enhancement aims to improve the visibility of degraded images to better align with human visual perception. While diffusion-based methods have shown promising performance due to their strong generative capabilities. However, their unidirectional modelling of degradation often. This paper introduces an efficient and robust Frequency-Space Recovery Network (FSRNet), specifically designed for low-light image enhancement in architectural contexts, tailored to the unique characteristics of such scenes. The encoder utilizes a Feature Refinement Feedforward Network (FRFN) to. Considering both technologies for successful AI-based applications, we propose an edge-computing driven and

end-to-end framework to perform tasks of image enhancement and object detection under low-light conditions. However, while improving image brightness, it is difficult to effectively maintain the texture and details of the image, and the quality of the image cannot be guaranteed. This research problem was solved with the help of the proposed image enhancement model aimed at increasing the visibility and. However, current image restoration methods predominantly focus on recovering images from RGB images, overlooking the potential of incorporating more modalities. With the advancements in personal handheld devices, we can now easily capture images with depth information using devices such as mobile.

The Role of the Light Decay Enhancement Module

Low-light image enhancement techniques have significantly progressed, but unstable image quality recovery and unsatisfactory visual perception are still significant challenges.

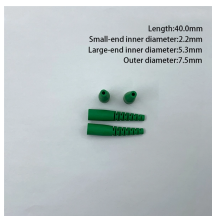

This study presents a versatile Low-Light Enhancement Module (LLEM) to enhance object detection models, particularly for workpieces in challenging lighting cond

Enhancing low-light images in construction scenarios is crucial for reliable structural health monitoring and automated defect detection in building projects.

To address the issues of low model perception and decreased detection accuracy caused by low-light image characteristics, we designed a low-light enhancement module.

In order to solve this problem, this paper proposed a low-illumination enhancement method based on structural and detail layers. Firstly, we designed an SRetinex-Net model. The ...

This not only demonstrates the importance of introducing depth information for low-light image enhancement, but also validates the effectiveness of the MFC module we designed.

Enhancing low-light images in construction scenarios is crucial for reliable structural health monitoring and automated defect detection in building ...

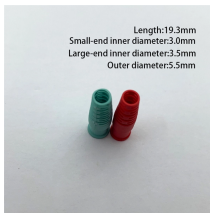

We propose parallel and dynamic enhancement subnet-works for extremely low-light image enhancement in cloud computing stage, which not only saves computing time by parallel running ...

Hence, this study aims to help improve video object detection, particularly in regions of low illumination, utilizing the Enhanced Zero DCE model. This deep-learning framework does not require any ...

To address these challenges, we propose a bidirectional diffusion optimization mechanism that jointly models the degradation processes of both low-light and normal-light images, ...

IAFE is explicitly designed for detection-oriented enhancement by jointly modeling unified light adaptation and extracting object-related features, thereby aligning the optimization objectives of ...

Low-light image enhancement techniques have significantly progressed, but unstable image quality recovery and unsatisfactory visual ...
