What are the uses of optical port modules

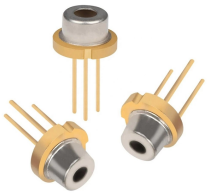

Overview

Optical modules are compact devices that convert electrical signals into optical signals and vice versa. They are used in fiber optic communication systems to transmit data over long distances with minimal loss and interference. As the demand for faster and more reliable internet and data services grows, understanding these devices becomes increasingly important. As the core optoelectronic devices operating at the Physical Layer of the OSI model, their primary function is to perform electro-optical and photo-electric conversion during signal. As an essential component of optical fiber communication, optical modules are optoelectronic devices that facilitate the conversion between optical and electrical signals during the transmission process.
