What does two inputs and one output mean in a beam splitter

The PDL emulator can include a polarization beam splitter (PBS) optically connected to the second polarization controller at an input side of the polarization beam splitter to split the optical signal from ...

As usual with this long-running series, details are scarce - meaning we don't know whether they're Hardy edits, blends, or merely previously tape-only cuts (he often played unreleased music and his own ...

ThorLabs cube beam splitter holder provides precise, stress-free mounting for 1/2 cubes, ensuring minimal birefringence and maintaining alignment stability essential for advanced optical research and ...

A 99:1 beam splitter (BS-2) then splits the optical power: the 1% branch is routed to the heterodyne signal port through a short fiber and a 1.7-dB optical attenuator, whereas the 99% branch is directed ...

It appears that a jbeam device only have to specify where to take power from, and does not specify where it sends power to. The only information I can find about powertrain devices ...

PLC splitter, also called Planar Waveguide Circuit splitter, is a device used to divide one or two light beams into multiple light beams uniformly or combine multiple light beams to one or two ...

This process is passive, meaning it doesn't amplify or modify the signal in any way. Instead, the splitter relies on the principle of beam splitting, where the input signal is divided into multiple ...
