

What to do if the cold-joint connection is unstable

Overview

Epoxy injection is the standard repair for leaking cold joints. A technician drills injection ports along the joint, then pumps epoxy that fills the gap and bonds to both concrete surfaces. Cost typically runs \$200 to \$400 per linear foot. In this guide, we'll walk you through identifying cold solder joints, repairing them. A cold solder joint forms when the solder does not properly bond the component lead to the pad—typically due to inadequate heat, oxidation, or poor technique. While these joints may look acceptable at first glance, they can become problematic over time, especially when exposed to vibration, thermal. Poor connection quality is likely to occur if the soldering process is not handled properly, such as insufficient heating temperature, using too little or too much solder, working on dirty or oxide on the soldering surface, or the components moving during soldering. They may feel loose to the touch. When concrete sets up before the next batch arrives, the bond between the old and new material never fully develops. I see cold joint questions come up.
