

Which wire in the distribution box is the circuit breaker

Overview

Live (L) Wire Connection: In a distribution box setup, the incoming live wire (also known as phase or hot wire, denoted as L or Line) connects to the line terminal of the circuit breaker. This serves as the primary source of electrical energy from the mains supply. Single Phase Distribution Box generally consists of Double Pole MCBs, Single Pole MCBs, and RCCBs. Circuit breaker wiring configurations involve organizing main switches, busbars, and branch breakers within a distribution box. This diagram illustrates some of the most common circuits found in a typical 200 amp circuit breaker service. Your breaker box wiring includes three main wire types: black hot wires carry electricity to outlets, white neutral wires return unused power, and green ground wires prevent electrocution.
