The MP-3000 motor protection relay has three-phase and one ground current inputs. Both a 5A and 1A version are available. The ground protection and metering functions can be used with either a zero ...

This mode is characterised by a lower starting current (limited to approximately twice the nominal current) and a starting torque which nevertheless remains high (1.5 to 2 times the nominal torque).

The ground protection can be used with either a zero sequence ground CT or from the residual connection of the phase CTs. The zero sequence ground CT provides greater ground fault sensitivity ...

The arc detection/protection schemes of the IEDs increase personnel safety and limit material damage within the switchgear in an arc fault situation.

Keep wiring separate from high voltages and power lines that draw large currents. Do not place product wiring in parallel with or in the same path as high-voltage or high-current lines.
